

MQ Performance Benchmarking

Methodology & Tools

Presentation Contents

■ Background Information

- ▶ MQ Programming Interface (MQI) & Programming
- ▶ MQ Internal Processing

■ Benchmarking Approach

- ▶ Benchmark Testing Goals
- ▶ Benchmark Limitations

■ Available Tools (Free)

- ▶ “q” Program (formerly SupportPac MA01 by Paul Clarke)
- ▶ IBM SupportPac MH04 (“**xmqgstat**” Queue Statistics)
- ▶ IBM **PerfHarness** & IBM **PerfRating**
- ▶ IBM **amqsrua** & **amqsmon** commands
- ▶ UNIX “**top**” command & Microsoft Windows **PerfMon** tool

■ Testing Automation

- ▶ “**JUnit**” & “**JMeter**” Test Frameworks

■ Summary

MQ Performance Benchmarking

Background Information

MQI (Message Queue Interface)

MQ Programming - 1

■ MQI Language Support

- ▶ C, COBOL, PL/I , RPG (MQI)
- ▶ Java (MQ Classes for JMS, MQ Classes for Java)
- ▶ C++, .Net (XMS)

■ MQ API Programming

- ▶ The MQConn call is the most expensive MQI action.
- ▶ MQGet & MQPut calls should be performed within a loop.
 - The MQConn/MQDisc& MQOpen/MQClose are outside of the loop
 - MQPut1 can be used for exception calls, not routine processing.

■ Message Persistence

- ▶ All persistent messages are written to the log.
- ▶ Both persistent & non-persistent messages **may** be written to disk for the queue.
- ▶ Messages are processed from memory whenever possible.

■ MQ Thread (MQConn) Processing

- ▶ The MQConn handle is held by a single thread.
- ▶ Within a MQConn handle, calls to MQ are single threaded.
- ▶ Thus, MQ calls are synchronous and blocked within a handle.

MQ Programming - 2

- Different language APIs will have different performance characteristics
- Different API calls have different costs
 - ▶ “Connect” is the most expensive call (in terms of latency)
 - ▶ “Get” calls have things to consider
 - Message Filters – response times degrade as queue depths increase
 - Lock Contention – response time degrades as number of “Readers” increases
- API Calls are one of the MQ Bottlenecks!
 - ▶ Maximum number of API calls / second based upon the API call path length
 - ▶ Application Architects and WMQ Administrators should know this number!
 - ▶ Easy to determine, use the “Q” program (Thank you Paul Clarke)
 - `crtmqm TempQmgr`
 - `strmqm TempQmgr`
 - `echo “define qlocal(‘TempQueue’)” | runmqsc TempQmgr`
 - `date`
 - `echo “#!1000000/1024” | /...path.../q -m TempQmgr -ap -p1 -O TempQueue`
 - `date`
 - The preceding commands write 1,000,000 messages of 1K size

MQ Internal Processing

■ API Calls

- ▶ Each Connection Handle (HCON) is associated with a single thread!
- ▶ API calls through the same Connection Handle are single-threaded!
- ▶ API Path Length is approximately 1-2 ms, resulting in < 1,000 MQ calls per second.

■ Persistent messages are written to the log

- ▶ Message cannot be released to the application until the log write completes.
- ▶ Non-persistent messages are roughly 10 times faster than persistent messages!

■ WMQ channel protocol is a blocking protocol

- ▶ MCA waits for an acknowledgement after each block is transmitted.
 - Impacted by Batch Size (BATCHSZ) parameter.
 - Impacted by the Batch Interval (BATCHINT) parameter.
- ▶ MCA agents on each Queue Manager must update the log for persistent messages.
- ▶ Multiple channels between Queue Manager pairs will significantly increase throughput.
- ▶ Message delivery sequence is generally “First In First Out” (FIFO)
 - Separating large from small messages can yield significant QoS improvements

MQ Performance Benchmarking

Benchmarking Approach

Benchmarking Context

■ Performance Measurements

- ▶ Capacity; e.g. Transactions per Second (TPS).
- ▶ Latency; e.g. Seconds per Transaction.

■ Benchmarking Targets

- ▶ Infrastructure capacity (maximum)
- ▶ Application capacity (maximum)

■ Benchmarking Measurement Granularity

- ▶ Single thread.
- ▶ Multiple threads per container (e.g. Integration Server).
- ▶ Multiple servers.

Benchmarking Limitations

■ Benchmarking Challenges

- ▶ Infrastructure easier to benchmark
 - Test Tools exist & Stub programs easily constructed
 - Components can be tested in isolation
- ▶ Applications more difficult to benchmark
 - Integrated End-to-end testing required
 - Database & other external software dependencies
 - Test data required

■ Data Limitations

- ▶ Test data normally based upon functional testing requirements
- ▶ Test data often not able to detect:
 - Database lock management issues
 - Database deadlocks issues

Benchmarking Goals

■ Current application capacity determination

- ▶ Planning for peak load readiness
- ▶ Planning for infrastructure capacity increases
 - Additional servers and/or licenses

■ Identify vertical scaling opportunities

- ▶ Upgraded software (e.g. newer release of MQ)
- ▶ More server resources
 - More/Faster CPU, More memory, Faster disk

■ Identify horizontal scaling capabilities

- ▶ More threads per container (e.g. Message Flow).
- ▶ More containers (e.g. Integration Servers).
- ▶ Increased Application isolation (e.g. Integration Servers/Nodes)
- ▶ More servers.

Benchmarking Approach

- **Benchmark measurements**
 - ▶ Reader & Writer performance
 - ▶ TPS & Latency
- **Benchmark Infrastructure (per thread)**
- **Benchmark Infrastructure scaling (multiple threads)**
 - ▶ Identify performance bottlenecks (Readers > Writers)
 - (Queue locking)
 - ▶ Identify performance bottlenecks (Writers > Readers)
 - (Queue search)
- **Benchmark Applications**
 - ▶ End-to-End benchmarks
 - Single-thread performance
 - Multiple-thread performance

MQ Performance Benchmarking

Tools – “Q”

“Q” Program

■ Tool Overview

- ▶ Program reads from a “source” (STDIN) and writes to a “target” (STDOUT)
- ▶ “Source” may be keyboard, file, Queue, or Subscription
- ▶ “Target” may be screen, file, Queue, or Topic
- ▶ Multiple test data generation and behavior options available

■ Tool Highlights

- ▶ Simple to use
- ▶ Documented through a short “Readme.txt” file.
- ▶ Supported on many platforms, but may require compilation first.
- ▶ Capable of generating testing loads
- ▶ Large number of command parameters available for specialized uses
 - Many MQI parameter options supported

■ Tool History

- ▶ Developed by Paul Clarke of the Hursley Laboratory
- ▶ Developed by Paul as a Hursley testing tool
- ▶ Originally released for public use as a SupportPac (MA01) – August 1995
- ▶ Currently available as Open Source through GitHub
 - <https://github.com/ibm-messaging/mq-q-qload>

“Q” Program Invocation

■ Queue Manager Connection (-I for “library”)

- ▶ Default behavior is to use “Server Binding” mode (local Queue Manager) → **-I mqm**
- ▶ TCP/IP “Client Binding” mode is also support → **-I mqic**
- ▶ Identify Queue Manager (if not default) → **-m queueManagerNameHere**

■ Program Input and Output

- ▶ Program reads from a “source” (STDIN) and writes to a “target” (STDOUT)
 - Standard redirection operators (“<”, “>”, “>>”) for file I/O
- ▶ Program parameters supported for specific I/O sources
 - “Source” may be keyboard, file, Queue, or Subscription
 - “Target” may be screen, file, Queue, or Topic
- ▶ Standard pipe (“|”) processing supported
- ▶ **“-f fileNameHere”** → Read input records from the named File
- ▶ **“-i queueNameHere”** → Browse input messages from the named Queue
- ▶ **“-I queueNameHere”** → Read (destructive) input messages from the named Queue
- ▶ **“-o queueNameHere”** → Send output to the named Queue (Bind not Fixed)
- ▶ **“-O queueNameHere”** → Send output to the named Queue (Bind on Open)
- ▶ **“-S subscribeOptions”** → Subscription options (see “ReadMe”)
- ▶ **“-T publishOptions”** → Topic options (see “ReadMe”)

“Q” Program Invocation- continued

■ Queue Parameter Name Format (Supported for multiple parameters)

- ▶ One part format (Queue name only)
- ▶ Two part format (Queue Manager Name & Queue Name)
- ▶ Multiple “part” separators supported:
 - **/** , **** , **#** , **,**

■ Key Performance Testing parameters

- ▶ **-an** → MQPut non-persistent messages
- ▶ **-ap** → MQPut persistent messages
- ▶ **-p** → Number of messages between Commit points
- ▶ **-L** → Maximum number of messages to process
- ▶ **-r *queueNameHere*** → “Reply To” Queue Name
- ▶ **-r+ *queueNameHere*** → Read message from “Reply” queue before next MQPut
- ▶ **-t** → Print timing information about each API call
- ▶ **-w** → Number of seconds to wait for a message to arrive (MQGet parameter)
- ▶ **-W** → Number of milliseconds to wait before MQGet call (simulates processing time)
- ▶ **-y *tenthsOfSeconds*** → Set message expiry interval (1/10 of second increments)
- ▶ **-1** → Use MQPut1 (MQOpen-MQPut-MQClose) instead of MQPut

“Q” Program Invocation- - continued

■ Test Data Input

- ▶ Input messages contained in an existing Queue
 - Use the “-i” parameter to save the messages!
- ▶ Input messages contained in an existing File (records)
 - “-f *fileNameHere*” → Read input records from the named File
 - “< *fileNameHere*” → Redirect input to the named File

■ Test Data Generation

- ▶ Input data contains test data generation instructions!
- ▶ Format is “#[!][c][*number*[/*size*[/*delay*[/*commit*]]]” *messageDataHere*
 - “#” → Indicates “test data generation command”
 - “!” → Do not include this instruction in the message (Optional)
 - “c” → Checksum messages (Optional)
 - “*number*” → Number of messages to generate (Optional)
 - “/*size*” → Message size in Bytes (Optional).
 - Data padded with low-values (x00)
 - “/*delay*” → Delay (in seconds) between each put.
 - “/*commit*” → Commit interval (in messages) between each MQCmit.

“Q” Program Examples

- `q -l mqm -m qmgrName -l requestQ -o replyQ -w 60 -W 20 -t`
 - ▶ **Read** input from the named queue (*requestQ*)
 - ▶ Write output to the named queue (*replyQ*)
 - ▶ Wait 60 seconds for message to arrive before terminating (e.g. allow testing to start)
 - ▶ Simulate 20 milliseconds of message processing time (e.g. 50 messages/sec)
- `q -l mqm -m qmgrName -ap -p1 -r replyToQ -o requestQ -t < fileName`
 - ▶ Read input from the named file (*fileName*)
 - File data is “#!100000/1040 Request Message.”
 - ▶ **Write** output messages to the named queue (*requestQ*)
 - ▶ 100,000 persistent 1k length messages (“Test Message...”) written to queue
 - ▶ Commit on every message
 - ▶ “Reply To” Queue name specified (*replyToQ*)
- `q -l mqm -m qmgrName -i inputQ -o outputQ1 -o outputQ2`
 - ▶ Read input from the named Queue (*inputQ*)
 - ▶ **Copy** input messages to output (two) queues!
 - Output queue #1 (*outputQ1*)
 - Output queue #2 (*outputQ2*)

Using the “Q” program

■ Simulating “Writer” Applications

- Simulate application (**single thread**) “Writing” messages.
- Multiple instances may be spawned, if required.
- The “-r+ *queueName*” parameter may be used to slow down the writer.
 - Writer will read the reply message before putting the next message.
 - The reply message may be delayed (“-W 20”) to slow down the writer.

■ Simulating “Reader” Applications

- Simulate application (**single thread**) “Reading” messages.
- Multiple instances may be spawned, if required.
- The “-W 20” parameter may be used to slow down the reader.

■ Platform Benchmarking

- Use without delays to benchmark platform capability (single thread)
- Test with increasing numbers of *Readers* and *Writers* to benchmark horizontal scaling
- Combine with platform measurements (CPU, Memory, Network)

■ Application Benchmarking

- Use with Application software to simulate external systems

“Q” Program Output

```
Administrator: IBM Integration Bus 10.0

c:\WMQ Support Tools\WMQ SupportPac MA01 - Q Program>q.exe -l mqm -m IB10QMGR -ap -p1 -r test.out -o test.in < testdata.txt -t

MQ Performance Benchmarking

Tools – “xmqqstat” (MH04)

xmqstat (MH04) Program

■ Tool Overview

- ▶ Queue Statistics monitoring tool (written in Java)
- ▶ Category 2 SupportPac (“As Is” – no official IBM Support)
- ▶ Authored by Oliver Fisse of IBM Software Group (ISSW) – November 2010
- ▶ Some minor configuration is required.

■ Tool Highlights

- ▶ Simple to use
- ▶ Documented through a short “Readme.txt” file.
- ▶ Each instance of the program monitors a single queue.
- ▶ Companion program may be used to monitor multiple queues.
- ▶ Activity and queue status are reported at specified intervals.

■ Key Reported Data

- ▶ Time → Current Time
- ▶ OIC/OOC → Input Count (e.g. reading threads) / Output Count (e.g. writing threads)
- ▶ MEC/MDC → Enqueue count (messages written) / Dequeue count (messages read)
- ▶ UNC → Uncommitted messages (at end of monitoring interval)
- ▶ QCD → Current Queue Depth (at end of monitoring interval)
- ▶ MxQD → Maximum Queue Depth (during monitoring interval)

xmqqstat – Additional Features

■ Extended Data (“-e” parameter)

- ▶ PQF → Percentage Queue Full (during monitoring interval)
- ▶ TQF → Time to Queue Full (at present enqueue rate)
- ▶ TQE → Time to Queue Empty (at present dequeue rate)
- ▶ The following extended data requires Queue Monitoring (MonQ) to be turned on
 - QOM → Queue Oldest Message (Age of oldest message in queue)
 - OQTS → Output Queue Time (Short) – Average time messages spent in queue
 - OQTL → Output Queue Time (Long) – Average time messages spent in queue

■ Application Handle Information Reported (-h option)

- ▶ Data displayed as per DIS QS(*queue*) TYPE(HANDLE)

■ Key Parameters

- ▶ -d Duration to collect statistics (in Seconds)
- ▶ -e Extended statistics (some require MONQ enabled)
- ▶ -h Display information about Application Handles
- ▶ -i Statistics collection interval (in Seconds)
- ▶ -m Queue Manager name
- ▶ -q Queue name
- ▶ -s Suppress display if no activity during interval
- ▶ -t Display time

xmqqstat Examples - 1

- **Monitor local Queue Manager / Queue for 5 minutes; summarize each minute:**
 - ▶ `xmqqstat -m Qmgr -q Queue -d 300 -i 60 -e -s -t`
 - Connect to local Queue Manager using Server bindings
 - Collect statistics on *Queue* (-q) in *Qmgr* (-m)
 - **Collect statistics for 5 minutes (300 seconds) (-d)**
 - **Report statistics every minute (60 seconds) (-i)**
 - **Collect extended statistics (-e)**
 - Don't report an interval if there is no activity (-s)
 - Display the time (-t)
- **Monitor remote Queue Manager / Queue ... :**
 - ▶ `xmqqstat -c SYSTEM.DEF.SVRCONN -x hostname(1414) -m Qmgr -q Queue ...`
 - Connect to remote Queue Manager using Client bindings
 - Collect statistics on *Queue* (-q) in *Qmgr* (-m)
 - **Connect to server *hostname* using port 1414 (-x)**
 - **Use **SYSTEM.DEF.SVRCONN** channel (-c)**

xmqqstat Examples - 2

■ Indefinitely Monitor local Queue Manager / Queue Application connections:

- ▶ `xmqqstat -m Qmgr -q Queue -i 3600 -h -e -s -t`
 - Connect to local Queue Manager using Server bindings
 - Collect statistics on *Queue* (-q) in *Qmgr* (-m)
 - **Collect statistics indefinitely** (no -d parameter)
 - **Report statistics every hour(3600 seconds) (-i)**
 - **Display Handle information (-h)**
 - Collect extended statistics (-e)
 - Don't report an interval if there is no activity (-s)
 - Display the time (-t)

■ Note on tool execution:

- ▶ **PCF commands used to reset Queue statistics for Enqueue/Dequeue calculations.**
 - PCF command "Reset Queue Statistics".

■ Note on execution duration:

- ▶ If Duration (-d) parameter is not specified, then duration is unlimited.
- ▶ The Ctrl-C command can be used to stop execution.

MQ Performance Benchmarking

Tools – “PefHarness”

“PerfHarness” Program

■ Tool Overview (v1.2)

- ▶ Tool built in Java
- ▶ Tests MQ, JMS (MQ, WMB, JNDI), TCP/IP, HTTP, REST, & SOAP transport protocols
- ▶ Significant configuration may be required.

■ Tool Highlights

- ▶ Large number of built-in test (“Test Classes”) supported
- ▶ Powerful testing capabilities
- ▶ Supports testing with multiple threads
- ▶ Supports “throttled” operations (limiting messages/second)

■ Tool History

- ▶ Developed by Marc Carter as an internal IBM tool
- ▶ Used by IBM to develop the WMB/IIB Performance Report SupportPacs
- ▶ Previously available through IBM AlphaWorks & developerWorks
- ▶ Currently available as Open Source through GitHub
 - <https://github.com/ot4i/perf-harness>

PerfHarness Installation - 1

- **Download and install Eclipse IDE for Java SE (Oxygen)**
 - ▶ Open Source software from Eclipse.org
 - <http://www.eclipse.org/downloads/packages/eclipse-ide-java-ee-developers/oxygenr>
- **Download and Install latest Java release (Java SE 9) into Eclipse**
 - ▶ Open Source software from Oracle
 - ▶ **Download the Java Development Kit (JDK), not the Java Runtime Environment (JRE)!**
 - <http://www.oracle.com/technetwork/java/javase/downloads/jdk9-downloads-3848520.html>
 - Add the Java 9 JRE (from the JDK) to Eclipse
 - Window → Preferences → Java → Installed JREs → Add → Standard VM
 - **Specify location of JDK, not JRE!**
- **Download and Import PerfHarness into Eclipse**
 - ▶ Open Source software (originally from IBM) through GitHub
 - <https://github.com/ot4i/perf-harness>
 - ▶ Import the PerfHarness projects into Eclipse

PerfHarness Installation - 2

- Refer to the documentation on the PerfHarness GitHub Page
- Download and Import PerfHarness Prerequisite Jar Files
 - ▶ Import prerequisite IBM MQ Jar files into Eclipse
 - ▶ Import AMQP Jar files into Eclipse (Only needed for AMQP protocol support)
 - <https://developer.ibm.com/messaging/ibm-mq-light-downloads/>
 - Download from Maven Central
 - ▶ Find and import ANT prerequisite Jar Files
 - <https://sourceforge.net/projects/ant-contrib/files/ant-contrib/ant-contrib-1.0b2/>
 - ant-contrib-1.0b2-bin.zip
- Correct any Java Errors
 - ▶ Java code errors
 - ▶ Build Path errors
- Build PerfHarness Java Project
 - ▶ Eclipse → PerfHarness → build_all.xml → (*Right Click*) Run As → 1 Ant Build
 - ▶ If successful, the PerfHarness.jar file will be created in the “build” folder

Eclipse Configuration

- **Follow the instructions on the GitHub PerfHarness page**
 - ▶ However, treat these instructions as guidelines
 - They do not reference MQ v9.x
 - They do not reference current names of required Jar files
 - They do not reference current versions of Java
 - ▶ The resulting project may contain “minor” errors
 - Jar file references
 - Java errors
 - ▶ **These errors must be resolved before the PerfHarness Jar can be built!**
- **Some familiarity with Eclipse and Java in Eclipse is essential!**
 - ▶ Java Project → Properties → Java Build Path
- **Others have already encountered these problems**
 - ▶ Google can help resolve many of the issues
 - ▶ IIB developers may have Eclipse & Java experience

PerfHarness – Test Preparation

- PerfHarness does not run as an executable Jar!
- Setup Java Classpath
 - ▶ Windows
 - set CLASSPATH=perfharness.jar;%CLASSPATH%
 - java JMSPerfHarness *-parameters*
 - java -cp "perfharness.jar;%CLASSPATH%" JMSPerfHarness *-parameters*
 - ▶ UNIX
 - export CLASSPATH=perfharness.jar:\$CLASSPATH
 - java JMSPerfHarness *-parameters*
 - java -cp "perfharness.jar:\$CLASSPATH" JMSPerfHarness *-parameters*
- Design Test
 - ▶ Writers
 - ▶ Readers
 - ▶ Request/Response
- Determine PerfHarness “Test Class” parameter
 - ▶ See “Notes”

PerfHarness – Test Designs

- Test **"Datagram"** message flows (MQMT_Datagram)
- Measure writing rate (messages/second) per thread.
- Test impact of additional "Writer" threads.
- Measure reading rate (messages/second) per thread.
- Test impact of additional "Reader" threads.

- Test **"Request" / "Reply"** message flows ("MQMT_REQUEST" / "MQMT_REPLY")
- Measure writing rate (messages/second) per thread.
- Test impact of additional "Writer" threads.
- Measure reading rate (messages/second) per thread.
- Test impact of additional "Reader" threads.

PerfHarness Example – MQ Requestor

■ java

- ▶ **-Xms**512M **-Xmx**512M (JVM parameters)
- ▶ **-cp** "C:\path\perfharness.jar;%CLASSPATH%" **JMSPerfHarness**
- ▶ **-tc** **jms.r11.Requestor**
- ▶ **-jh** *qmgrServer* **-jp** *qmgrPort* **-jc** *svrconn* (Client connection information)
- ▶ **-jb** *queueMangerName*
- ▶ **-jt** *mqc* (Use Client Bindings– “mqc”)
- ▶ **-iq** *inputQueue* **-oq** *outputQueue* (Queue names)
- ▶ **-nt** 5 (Number of threads)
- ▶ **-si** 100 (Start thread interval = 100 ms)
- ▶ **-rl** 300 (Test duration in seconds)
- ▶ **-ss** 60 (Reporting interval in seconds)
- ▶ **-sc** BasicStats (Statistics module)
- ▶ **-to** 120 (MQGet wait interval in seconds)
- ▶ **-su** (Display final summary information)
- ▶ **-mf** *inputFilePath&Name* (Input message from file)
- ▶ **-mt** *messageText* (Input message text)
- ▶ **-pc** WebSphereMQ (Use MQ as JMS provider)

PerfHarness Program Output

MQ Performance Benchmarking

Tools – “PerfRating”

“PerfRating” Program

■ Tool Overview

- ▶ CPU Performance Rating tool
- ▶ Requires Java 1.7 or above
- ▶ Provides an abstract rating (“Core Value”) that allows server comparisons

■ Tool Highlights

- ▶ Extremely simple to use
- ▶ Can be executed on each MQ and/or IIB server
- ▶ Allows the CPU processing capability of each server to be benchmarked
 - Can detect server set-up issues if “identical” servers produce different results
 - Can provide a basis for comparing disparate servers
- ▶ Especially useful for benchmarking Virtual Machine images

■ Tool History

- ▶ Developed by IBM Hursley to identify hardware performance issues
- ▶ Currently available through developerWorks
 - <https://developer.ibm.com/integration/blog/2015/11/21/perfrating-cpu-performance-rating-tool/>

Using the “PerfRating” Program

■ Tool Invocation

- ▶ `java -jar PerfRating.jar hursley.performance.tools.PerfRating -NumberOfThreads 1`
 - Test a single thread (e.g. core)
- ▶ `java -jar PerfRating.jar hursley.performance.tools.PerfRating -NumberOfThreads all`
 - Test all available threads (e.g. cores)

■ Tool Results

- ▶ Server Description
 - Number of Cores
 - Amount of Memory
 - Operating System build
 - JRE Information
- ▶ CPU Rating
 - Overall rating (“Value”)
 - Average Core rating (“Value”)

PerfRating Program Output

```
Administrator: IBM Integration Bus 10.0

java -jar perfRating.jar hursley.performance.tools.PerfRating -numberOfThreads all
IBM Integration Bus PerfRating Tool
Version: 0.1

Number of System CPU Cores: 1
Max Memory:536870912
Available Memory:3069200
OS Name: Windows 10
OS Version: 10.0
Java Runtime Version: pwa6470_27sr3fp60-20161021_01 (SR3 FP60)
Java Vendor: Oracle Corporation
Java VM Version: 2.7
Java Class Version: 51.0

Command Line option all - Setting Number of threads to 1
This command will put your system under full load on 1 thread
Are you sure you want to continue: yes/no
yes
Running 1 thread
ThreadId:13 - Calculating sequence to number 50 2 times
Took 195 seconds to run
Total CPU time: 195636ms, for 2 calculations

Rating Value:1022
Average Core Value:1022

MQ Performance Benchmarking

Tools – “amqsrua”

“amqsrua” Program

■ Sample Program Supplied with MQ

- ▶ Displays performance information published by Queue Managers
- ▶ Command displays information until stopped or “*Publication Count*” reached

■ Topic Tree

- ▶ \$SYS/MQ/INFO/QMGR

■ Program Location

- ▶ UNIX: *installationPath*/samp/bin
- ▶ Windows: *installationPath*\tools\c\Samples\Bin64

■ Command Parameters

- ▶ **-m** *qmgr* → Queue Manager name
- ▶ **-c** *resourceClass* → Resource Class: “CPU”, “DISK”, “STATQ”, “STATMQI”
- ▶ **-t** *typeName* → Resource Type
- ▶ **-o** *objectName* → Resource Object
- ▶ **-n** *pubCount* → Number of publications to report
- ▶ **-d** *debugLevel* → Level of debugging information to report
- ▶ **-h** → Display help information

amqsrua Class (“-c”) parameter values

- **Topic Tree**

- ▶ \$SYS/MQ/INFO/QMGR

- **amqsrua Class (“-c”) parameter values**

CLASS	Class Description
CPU	Queue Manager CPU usage
DISK	Queue Manager disk usage
STATQ	MQI Calls per Queue
STATMQI	MQI Calls

- **Some Class/Type combinations require an “Object”**

- ▶ “-o” parameter
- ▶ e.g. Queue Name

Class(es)	Type	Type Description
CPU / DISK	SystemSummary	System wide CPU usage
	QMgrSummary	Queue Manager CPU usage
STATQ	OpenClose	MQOpen & MQClose statistics
	InqSet	MQInq & MQSet statistics
	Put	MQPut statistics
	Get	MQGet statistics
STATMQI	ConnDisc	MQConn & MQDisc statistics
	OpenClose	MQOpen & MQClose statistics
	InqSet	MQInq & MQSet statistics
	Put	MQPut statistics
	Get	MQGet statistics
	Syncpoint	MQBegin, MQCmit & MQBack statistics
	Publish	Message Publishing statistics
	Subscribe	Message Subscription statistics

“amqsrua” Sample Program Output

```
Administrator: IBM Integration Bus 10.0
C:\Program Files (x86)\IBM\WebSphere MQ\Tools\c\Samples\Bin64>amqsrua.exe -m IB10QMGR
CPU : Platform central processing units
DISK : Platform persistent data stores
STATMQI : API usage statistics
STATQ : API per-queue usage statistics
Enter Class selection
==> STATQ
OPENCLOSE : MQOPEN and MQCLOSE
INQSET : MQINQ and MQSET
PUT : MQPUT and MQPUT1
GET : MQGET
Enter Type selection
==> PUT
An object name is required for Class(STATQ) Type(PUT)
Enter object name
==> test.in
Publication received PutDate:20170928 PutTime:00290171 Interval:2 hours,43 minutes,15.169 seconds
test.in MQPUT/MQPUT1 count 11
test.in MQPUT byte count 31
test.in MQPUT non-persistent message count 11
test.in MQPUT persistent message count 0
test.in MQPUT1 non-persistent message count 0
test.in MQPUT1 persistent message count 0
test.in non-persistent byte count 31
test.in persistent byte count 0
test.in lock contention 0.00%
test.in queue avoided puts 0.00%
test.in queue avoided bytes 0.00%

MQ Performance Benchmarking

Tools – “amqsmon”

“amqsmmon” Program

■ Sample Program Supplied with MQ

- ▶ Displays Statistics & Accounting information generated by Queue Manager
 - **SYSTEM.ADMIN.ACCOUNTING.QUEUE**
 - **SYSTEM.ADMIN.STATISTICS.QUEUE**
- ▶ Requires Queue Manager settings
 - ALTER QMGR **ACCTMQI (ON) ACCTQ (ON) ACCTINT (1800)**
 - ALTER QMGR **STATACLS (ON) STATMQI (ON) STATQ (ON)**
 - ALTER QMGR **STATCHL (HIGH) STATINT (1800)**

■ Program Location

- ▶ UNIX: *installationPath*/samp/bin
- ▶ Windows: *installationPath*\tools\c\Samples\Bin64

■ Accounting & Statistics data introduced in v6.0

- ▶ “MQI” settings enable reporting and the connection (“MQConn”) level
- ▶ While Accounting & Statistics messages have similar data, both can be useful
- ▶ Can be run “before” (cleanup) and “after” (report) benchmark tests
- ▶ Destructively reads messages unless the browse (“-b”) parameter is used!

MQ Accounting Messages

▶ Queue Manager settings

- ALTER QMGR **ACCTMQI (ON) ACCTQ (ON) ACCTINT(1800)**
- Data stored in: **SYSTEM.ADMIN.ACCOUNTING.QUEUE**

▶ Queue settings

- ALTER QLOCAL ... **ACCTQ (ON)**

▶ Record MQI data by connection (i.e. MQConn)

- Messages written when connection is closed (i.e. MQDisc)
- Messages also generated at Queue Manager **ACCTINT** intervals (30 min)
- API call counts (e.g. MQGet & MQPut) & total byte counts provided

▶ Note:

- Accounting information may also be specified on the MQCONNX call
- ALTER QMGR **ACCTCONO (ENABLED)** must also be set!

MQ Statistics Messages

▶ Queue Manager settings

- ALTER QMGR **STATACLS (ON) STATCHL (HIGH) STATMQI (ON)**
- ALTER QMGR **STATQ (ON) STATINT(1800)**
- Data stored in: **SYSTEM.ADMIN.STATISTICS.QUEUE**
- “STATACLS” setting is for automatically defined Cluster Sender channels

▶ Queue & Channel settings

- ALTER QLOCAL ... **STATQ (ON)**
- ALTER CHANNEL ... **STATCHL (HIGH)**

▶ Records Queue Manager wide data

- Messages generated at Queue Manager **STATINT** intervals (30 min)
- Messages also generated at Queue Manager shut down
- RESET QMGR TYPE (STATISTICS) → Forces message write
 - Can be used at the end of a benchmark test to generate a Statistics message
 - Required to be able to immediately see statistics!
- API call counts (e.g. MQGet & MQPut) & total byte counts provided

“amqsmmon” Program Parameters

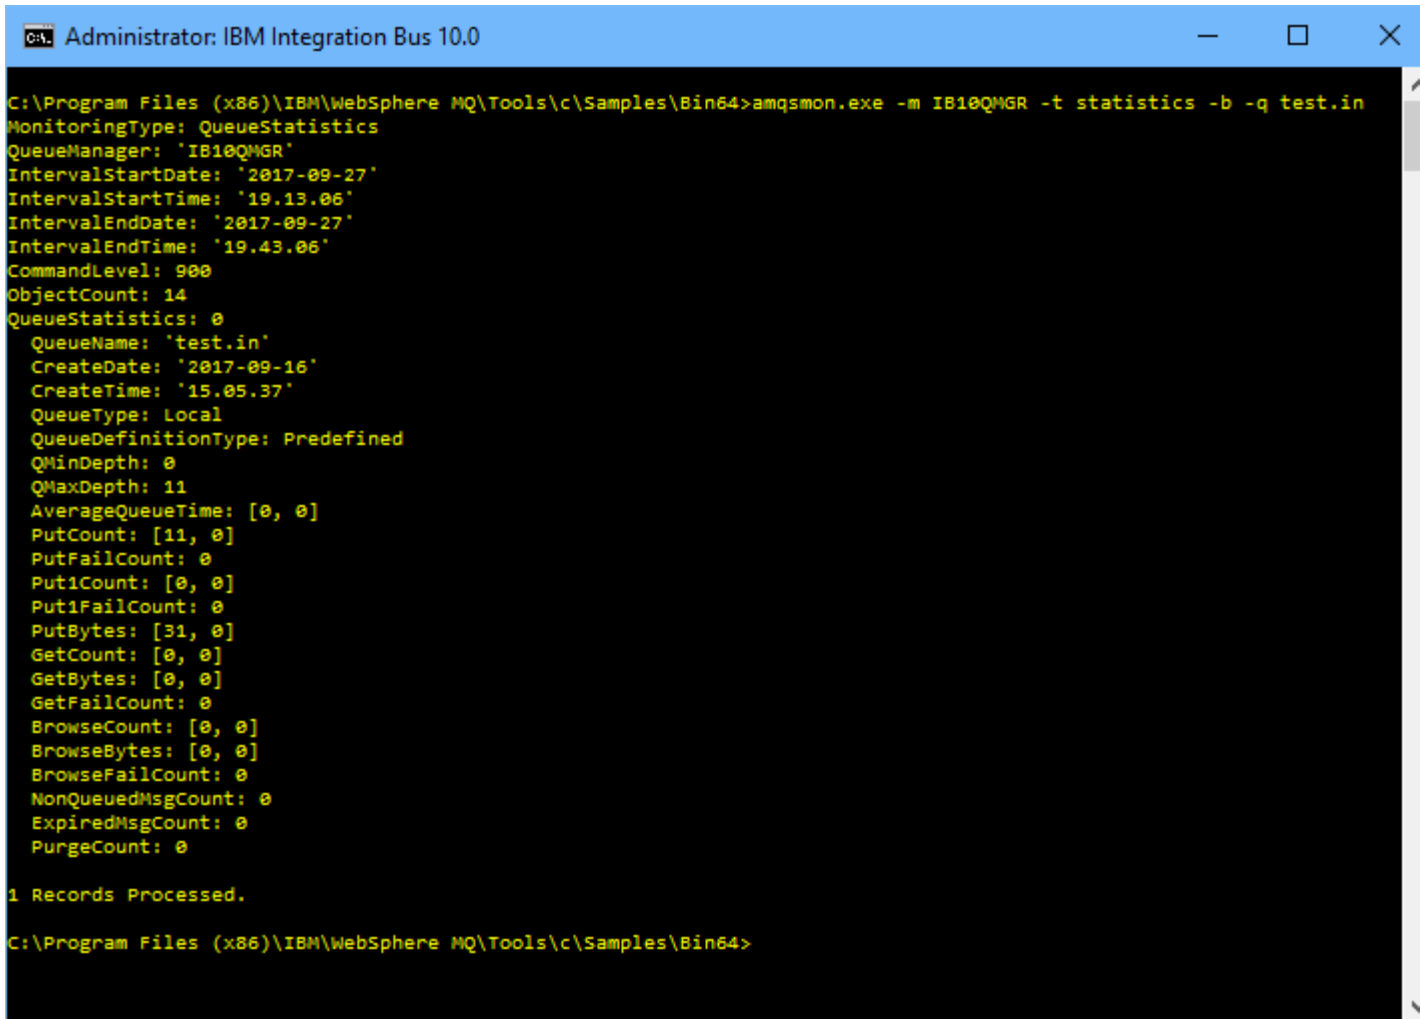

■ Command Parameters

- ▶ **-m** *qmgr* → Queue Manager name
- ▶ **-t** *type* → “**statistics**” or “**accounting**”
- ▶ **-s** *startTime* → Starting GMT reporting time (YYYY-MM-DD HH.MM.SS)
- ▶ **-e** *endTime* → Ending GMT reporting time (YYYY-MM-DD HH.MM.SS)
- ▶ **-l** *fieldList* → Comma separated list of fields to display
- ▶ **-a** → Display MQI information
- ▶ **-q** *queue* → Display Queue information (Queue name optional)
- ▶ **-c** *channel* → Display Channel information (Channel name optional)
- ▶ **-i** *connectionId* → Only display accounting Connection ID data (ID optional)
- ▶ **-b** → Browse messages
- ▶ **-d** *messages* → Maximum number of messages to process
- ▶ **-w** *seconds* → MQGet wait interval (in seconds) for a message to arrive

“amqsmon” Examples

- **amqsmon -m IB10QMGR -t accounting -b -q**
 - ▶ Display Accounting statistics for all queues -- save statistics messages
- **amqsmon -m IB10QMGR -t accounting -q *test.in***
 - ▶ Display Accounting statistics for the named queue (“test.in”)
- **amqsmon -m IB10QMGR -t statistics -q**
 - ▶ Display System statistics for all queues
- **amqsmon -m IB10QMGR -t statistics -q *test.in***
 - ▶ Display System statistics for the named queue (“test.in”)
- **amqsmon -m IB10QMGR -t statistics -c**
 - ▶ Display System statistics for all channels
- **amqsmon -m IB10QMGR -t statistics -c *test.svrconn***
 - ▶ Display Systems statistics for the named channel (“test.svrconn”)

MQ Performance Benchmarking

Tools – UNIX “top”

“top” Command Example

- **top**

- U *userIDforMQ*

- s *60*

- n *10*

- stats **UID,COMMAND,PID,CPU,TIME,THREADS,TIME,MEM,STATE**

- > *outputfile.txt*

- **Command description**

- ▶ Interactive (e.g. On Screen) display
 - ▶ “-U” determines the User (Name or ID) for reporting
 - ▶ “-s” determines the “sample” (statistics) interval (60 seconds)
 - ▶ “-n” determines the number of “samples” (statistics) to report (10)
 - ▶ “-stats” determines the data fields to be reported.
 - ▶ “>” redirects “stdout” from screen to the named file.
 - ▶ This command will thus run for 10 minutes, with a summary reported every minute.

“top” Command Output

MQ Performance Benchmarking

Tools – Windows “PerfMon”

“PerfMon” Program

■ Tool Overview

- ▶ Microsoft Windows Performance Monitoring tool
 - Measure CPU, Memory, Disk, and Network usage
- ▶ Microsoft Management Console (MMC) Snap-In

■ Tool Highlights

- ▶ Included in the standard Windows distribution
- ▶ May require installation through Control Panel (Add Programs)
- ▶ Customizable reporting
 - Data Collector Sets for defining collection & reporting data
 - Multiple output formats supported (e.g. CSV)

■ Tool History

- ▶ Developed by Microsoft and introduced in Windows NT 3.1
- ▶ Location and tool launching process has differed across Windows software releases

■ Tool Launch (Windows 10.1)

- ▶ Windows → Run → PerfMon

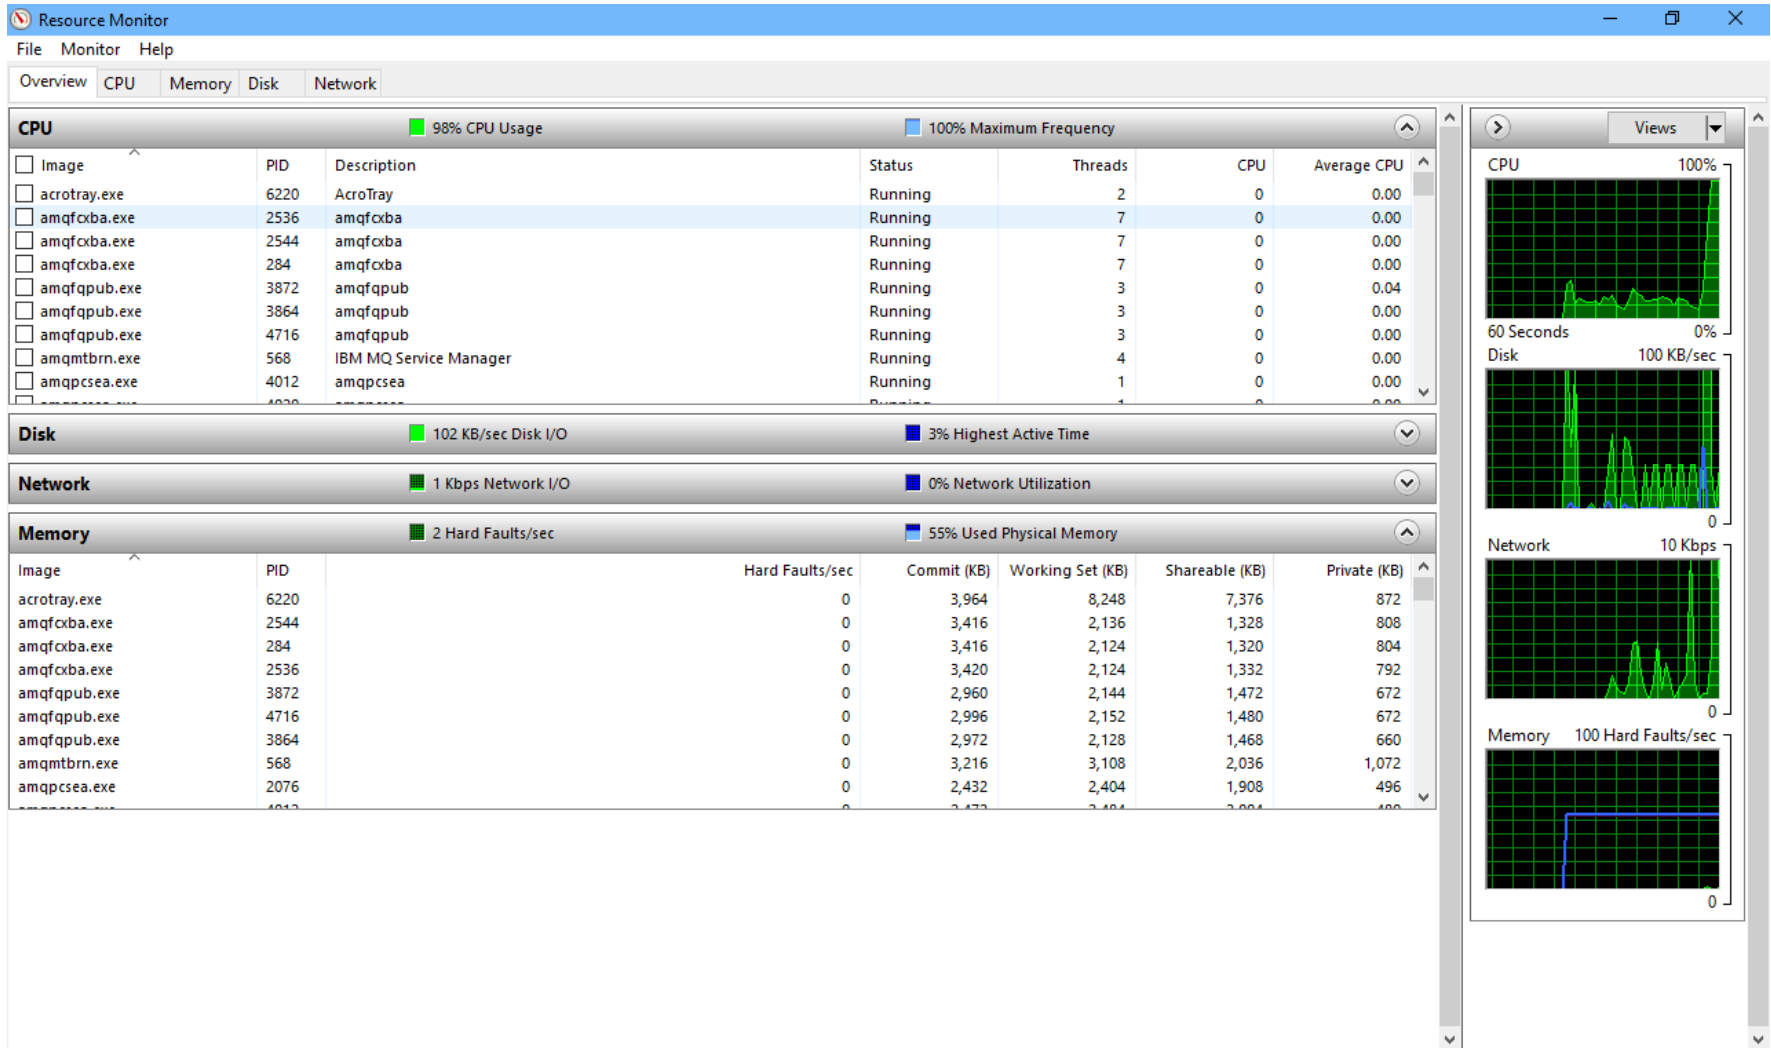

“PerfMon” Data Collector Sets

■ Data Collector Sets can be started and stopped independently

■ Creating a Data Collector Set

- ▶ Data Collector Sets → User Defined → (Right Click) New → Data Collector Set
 - Define Data Collector Set name (e.g. “IBM MQ”)
 - Create manually or from template
 - Select “Performance Counters” (fields to be reported)
 - e.g. “**Process**”, “**Processor Information**”, “**Memory**”,
 - Enter optional search criteria for each Performance Counter
 - e.g. “**amq**”, “**runmq**”, etc. for the “Process” probe
 - Select desired instances (or “<All Instances>”)
 - Select the fields to be reported with each Performance Counter
 - Final “Performance Counter” format is:
 - *\PerformanceCounterType(selectedInstance)\reportedFields*
 - e.g. \Process(amqrrmfa)*
 - Select log file data format
 - Binary, Comma Separated (CSV), Tab Separated, SQL

“PerfMon” Tool Output

MQ Performance Benchmarking

Tools – “JUnit”

“JUnit” Test Framework

■ Tool Overview

- ▶ Java based Open Source Test Framework
- ▶ Supports Java 8 or later
- ▶ Widely used (approximately 30% of Java projects)
- ▶ <http://junit.org/junit5/>

■ Tool Highlights

- ▶ Flexible components (JUnit Platform, JUnit Jupiter, JUnit Vintage)
- ▶ Formalized test descriptions for repeatable tests
- ▶ Extensible to any software that interfaces with Java

■ Tool History

- ▶ Evolved from “SUnit”, which was written in Smalltalk in 1994
- ▶ Currently available through junit.org
 - <https://github.com/junit-team/junit5/>

“JUnit” Integration with IIB

■ Open Source JUnit Extension

- ▶ Developed by Rocket-IT Consulting developed for IIB
- ▶ Available for download
 - <https://github.com/rockitconsulting/test.rockitizer>

■ IBM developerWorks documentation

- ▶ <https://developer.ibm.com/integration/blog/2017/08/29/junit-based-integration-testing-ibm-integration-bus/>

Title

Tools – “JMeter”

Additional Testing Tools

■ JMeter

- ▶ Open Source test framework from Apache
- ▶ Java based, so supports JMS testing
- ▶ Build a JMS test plan through the JMeter GUI
 - <https://blazemeter.com/blog/building-jms-testing-plan-apache-jmeter>
- ▶ Executes pre-built test plans
- ▶ Supports multi-threaded load testing
- ▶ <http://jmeter.apache.org>

Title

Summary

Take Away Points

- **Understand how Applications use MQ**
 - ▶ Datagram
 - ▶ Request/Response
- **Understand where Applications use MQ**
 - ▶ Servers
 - ▶ Queue Managers
 - ▶ Channels
- **Understand Application Infrastructure *Reader* and *Writer* thread counts**
- **Benchmark Infrastructure capability using “Q” or “PerfHarness”**
 - ▶ Use “Q” or “PerfHarness” to generate & measure test loads
 - ▶ Use “*xmqstat*”, “*amqsmon*“, or “*amqsrua*” to generate additional reporting data
 - ▶ Use “PerfMon” (Windows) or “top” (Unix) to report OS level statistics
 - ▶ Use “PerfRating” to compare CPU performance
- **Benchmark Application performance (End to End)**
 - ▶ Use same reporting tools as with Infrastructure
 - ▶ Capture input data (if possible) for replay
 - ▶ Replay input data using “Q” or “PerfHarness”

Questions & Answers

Presenter

- Glen Brumbaugh
 - Glen.Brumbaugh@TxMQ.com
- Computer Science Background
 - Lecturer in Computer Science, University of California, Berkeley
 - Professorial Lecturer in Information Systems, Golden Gate University, San Francisco
- WebSphere MQ Background (25 years plus)
 - IBM Business Enterprise Solutions Team (BEST)
 - Initial support for MQSeries v1.0
 - Trained and mentored by Hursley MQSeries staff
 - IBM U.S. Messaging Solutions Lead, GTS
 - Platforms Supported
 - MVS aka z/OS
 - UNIX (AIX, Linux, Sun OS, Sun Solaris, HP-UX)
 - Windows
 - iSeries (i5OS)
 - Programming Languages
 - C, COBOL, Java (JNI, WMQ for Java, WMQ for JMS)

Thank
You

The text "Thank You" is rendered in a large, bold, sans-serif font. Each letter is filled with a different portrait of a person. The "T" shows a man in a suit and tie. The "h" shows a woman in a green top. The "a" shows a man with a green face. The "n" shows a woman in a blue top. The "k" shows a man with glasses. The "Y" shows a man in a white shirt. The "o" shows a man in an orange shirt. The "u" shows a woman in a green top. The letters have a slight drop shadow, giving them a 3D appearance.
